## 3 reasons why remote workers count on RDX QuikStor for business continuity

### 1. Laptops fail – Data loss can occur at any time and for many reasons

In the home office, many employees are unprepared for hardware failure. Regular backups must be performed. Internet lines in the home are not always suitable for a fast and secure connection, so the addition of a **local backup** is vital to ensure that if the laptop fails, the data is still optimally backed up. RDX QuikStor connects easily to the laptop to provide offsite disconnected storage for **disaster recovery** and peace of mind.

### 2. The cloud has its pitfalls – network bandwidth, dropped connections, time consuming

If sufficient bandwidth is available, the cloud appears at first glance to be a suitable intermediate storage for data of remote employees. The storage space initially appears to be cost-effective and quickly available. However, the cost explodes, and the process is very time-consuming when restoring the data. A local backup with the RDX QuikStor system is **more affordable, cost-effective and secure**.

### 3. Ransomware and cyber-attacks on the rise – be protected

Data from home office workers may provide a platform for hackers or viruses because the home network is not always optimally protected. Thanks to the removable media of RDX QuikStor technology, the backup can be taken **offline** and thus withdrawn from online access. Even if the laptop is attacked, the backup remains intact.

The **shockproof** and durable design of the RDX QuikStor system is ideal for this purpose. The **portability** of the media also provides an additional option for sending the data to the data center securely and **encrypted** on a data carrier if required.
